PRP – Combination of the Prompt with human assessment

Key Findings

- **No improvement in consistency with human references.**
  Adding 10 examples of human assessment doesn't increase consistency between Claude iterations. On the contrary, the average delta slightly increases (5% vs 4%).
- **Prompt adherence improves selectively but inconsistently**
  Some iterations better follow specific rules (e.g. acronym-only evaluation for Title_clear), but this improvement is uneven and not generalized.
- **Human references influence interpretation, not alignment**
  Some iterations (Claude 2 and 3) adopt a stricter, more rule-based interpretation aligned with the human assessment, while others (Claude 1) retain a more qualitative approach.
- **Persistent scoring inconsistency despite similar reasoning**
  Across iterations, similar justifications often result in significantly different scores, indicating calibration issues rather than analytical differences.
- **Calculation errors persist**
  Errors in applying scoring rules (particularly the /3 penalty) remain present in multiple iterations, showing that human references do not reliably correct procedural mistakes.

#########

Introduction

The aim of this document is to answer the following question: does Claude show greater consistency when the prompt is combined with a series of human assessments used as a reference? To do so, we provided Claude with the same prompt and examples used in a previous analysis, along with human assessments of 10 text samples. We ran three iterations in Claude. As three iterations had also been conducted in a previous stage of the analysis, we are therefore able to compare the deltas with and without human assessments as a reference.

The detailed results delivered by the different LLMs are available HERE.

Observations

We do not observe an increase in consistency between the different Claude iterations when combining the prompt with human assessment references. On the contrary, there is a slight increase in the average delta (5% with human assessment references, compared to 4% without).

This can be partially explained by the degree to which the LLM relied on the human assessment samples as a reference.

For example, Claude2 and Claude3 adopted an interpretation of the prompt for the Title_clear criterion that is closer to the human assessment, limiting the evaluation to the use of acronyms. In contrast, Claude1 continued to assess the overall quality of the title, as was also the case in the three iterations without human assessment references.

- **Claude1** gave text sample 1 a **5/10** for Title_clear: *The title contains no acronyms but is quite long and dense. "Citizen-enhanced" is an unusual compound that may not be immediately clear, and "knowledge hubs" is somewhat jargon-adjacent*.
- **Claude2** gave text sample 1 a **10/10** for Title_clear: *The title contains no acronyms. It is a plain descriptive phrase*.

A similar situation can be observed for the Title_standalone criterion. The human assessment is highly focused on clarity, penalizing titles that are abstract, generic, or not explicit. Claude3 follows this interpretation, whereas Claude 1 does not.

- **Claude1** gave text sample 9 a **8/10** for Title_standalone: *The title is long but highly descriptive, clearly conveying the project's focus on language development through technology and innovation. A reader encountering it standalone would have a solid understanding of the project's thematic scope, even without the description*.
- **Claude3** gave text sample 9 a **1/10** for Title_standalone: *The title is excessively long and reads more like a mission statement than a project title. While the individual words are understandable, the overall combination is unwieldy and difficult to absorb at a glance. It does not convey a clear, memorable idea of the project on its own*.

We also continue to observe cases where similar justifications lead to significantly different scores.

- **Claude1** gave text sample 1 a **4/10** for Desc_funding: *The description introduces the thematic context (Citizen Science, Open Science, EU values) but is truncated before any concrete funding purpose, activities, or resource allocation can be understood.*
- **Claude3** gave text sample 1 a **6/10** for Desc_funding: *The description hints at the domain (Citizen Science as part of Open Science in HE) but is truncated before any concrete activities or resource allocation are mentioned. The funding purpose remains vague.*

In addition, calculation errors persist, particularly in the application of penalties. Only Claude3 doesn't apply wrongly the /3 penalty for simplicity in cases where the title is not in English. This can be illustrated by the scoring for text sample 3:

- **Claude1**: The description is written in accessible English. However, the title is not in English, triggering the /3 penalty. Initial score: 8/10 → 8/3 = 2.67 → 3/10
- **Claude2**: The description is clearly written in accessible English with no complex vocabulary. However, the title is in Swedish, triggering the ÷3 penalty. Base score: 8/10. 8/3 = 2.66 → 3/10
- **Claude3**: The description is written in plain, accessible English with no technical vocabulary or unexplained acronyms. The title, while in Swedish, is also straightforward in structure. The main barrier is the language of the title, not its complexity.
